

## Executive Summary

The above scatterplot displays the commits by their **file number** and the **week it was committed**. The most recent week is Week 0. The furthest week is at the top of the scatterplot. Data points are colored by the author. Files 0 to 10 have been updated recently, while files 12 - 16 have not.

The developer with the most commits is Matthew Rollings (50). The developer with the least is Grubeli (1). The most recent commits are by Grubeli and Scott Alexander-Bown. The files most recently worked on by developers are `toolChecker.cpp`, `CheckForRootWorker.kt`, and `RootBeerNative.java`. There are 132 total commits. The developer that could've left the project is Grubeli since he only committed once.

One useful git command was **git checkout** because I could easily switch between branches. **git commit -m** was also useful to commit to the remote repository and include a helpful message for other contributors to read.
